Notes

Push Feel

Coming in with a just under medium-strength tactile bump, the MODE Tomorrows start early and have a rather long-running bump that occupies the majority of the downstroke until the very shortened bottom out is reached. While not overly forceful, it is definitely the star of the show between two medium firmness housing collisions and some subtle amount of thin scratch and leaf/spring ping that leave these switches with some slight room for improvement.

Wobble

Consistent across the batch, the MODE Tomorrows feature very little N/S and E/W stem wobble and are rather consistent about it across the batch that I received. While not quite pushing the absolute limits like Outemu *can* do, these are still fairly respectable all things considered.

Sound

Without a doubt, the sound is going to be the thing that make or break these switches for most people. While all-nylon, long stem pole, and medium tactility all conjure up a fairly solid picture in one's mind, the Tomorrows are simply not that. They are more raw, more muted, and an altogether much more subtle sounding switch that many people could enjoy but few would expect.

Context

Priced at \$0.65 per switch as a long in-stock option from MODE, a vendor which has carried the same custom switch offerings for over 3 years now, these check all the boxes for consistency, availability, and longevity in this category. The price per performance metric could be slightly better, and the pack size does make it a little hard for many newcomers to willingly try out these switches, but all things considered they're an extremely solid offering outside of the package.

Other

The overall aesthetic design and implementation of these switches, while perhaps a bit overdone to a degree, is exciting and certainly uncommon to see from larger vendors as such.
