Notes

Push Feel

Made through and through with mystery, Tecsee-secret thermoplastics, the Chocolate Crinkle Cookie switches are medium-light tactile switch that has a mid-stroke, short and just barely not snappy tactile bump that is reminiscent of the classic tactility of Cherry MX Browns. While this is accented by flat, somewhat firm housing collisions, the switch also has equally competitive downsides detracting from the feeling including some subtle, small grain scratch and inconsistent bottoming out feelings.

Wobble

These switches have a slightly above average amount of N/S and E/W direction stem wobble that could potentially bother some users who are more picky about this metric than others and/or those who are using taller keycap profiles.

Sound

On the whole, the small tactile bump of the KNC Keys Chocolate Crinkle Cookies does very little to influence the sound profile of the switch which is instead largely driven by the medium-loud, flat, and ever so slightly pointed sounding plastic bottom out of the stem pole onto the bottom housing. While scratch and inconsistent tones are just as present here as in the push feeling notes above, it overall doesn't make for too bad (or too good) of an experience.

Context

Priced at \$0.44 per switch and pushed as part of KNC Keys' small 'treat' family of switches, these certainly have recognition and availability though are not nearly as lauded as their Ube-flavored relatives. Paired with general manufacturing issues of Tecsee these switches are far from bad but also ever likely to be replaced by newer and better offerings by KNC Keys in the future.

Other

The most appreciable quality of these switches is by far their willingness to cater to the lighter tactile end of the switch spectrum – something historically passed over by most companies.
