Notes

Push Feel

The Keygeek VC switches are a medium-light weight, well lubed linear switches right out of the box with oddly variable bottom out strengths. While the topping out remains subtle and with an ever so slight firm pop, the speed and force at which the stem is depressed in the VCs directly correlates with their bottom out feeling – soft, normal typing speeds yields a muted, ever so slightly snappy touch while faster, aggressive typing speeds yields a harsher, more poke-y, and less consistent feeling. While this inconsistency is generally not something that is enjoyable to most, it's sheer ability to be tuned here gives these switches quite a standout character.

Wobble

There is a small, equal magnitude N/S and E/W direction stem wobble in the VC switches that is not the most consistent from switch to switch but also not likely to bother all that many people.

Sound

While the push feeling of these switches is pretty wildly modifiable by typing speeds, their sound isn't so much. With the exception of extreme typing speeds or aggression, the VCs are fairly quiet, slightly snappy linears with no factory lube inconsistencies or scratch to their tone. The more aggressive typing speeds, though, yield something that is much more harsh, grating, and directly sharp on the ears.

Context

Priced at \$0.30 per switch and available via Unikeys, these switches have some market and accessibility though just lack of any of the follow through that could make them a western linear switch mainstay if they were just marketed, stocked, or pushed harder by their designer in picnic.works or their sole supporting vendor.

Other

Despite my uncertainty as to the real effects of 'proprietary' material blends, the combination of U4+UPE stems and POM bottom housings is an interesting marketing point in these switches...
