### Notes

#### Push Feel

While a slight bit rubbery at bottoming out, these silent linear switches are otherwise incredibly strong performing with an equally balanced pair of dampened housing collisions on either end of a frictionless smooth stem travel. For all intents and purposes, these are about as good as anyone has made silencing pads yet in terms of high dampening with a low sludgy, rubbery feeling.

#### Wobble

Much like with other over-engineered TTC premium switches, the beefier top housing structure in the TTC OG Rabbits really helps cut out virtually all stem wobble in either direction. Only the tiniest fraction of N/S and E/W direction stem wobble remains.

#### Sound

In terms of the stem/slider rail interface as well as the housing collisions, these two switches are for all intents and purposes *absolutely* silent. The only thing that creeps into the sound of these switches, to any degree, is a subtle amount of spring ping which is more evident at higher actuation speeds.

#### Context

To a degree, the context for switches like these is incredibly hard to pin a proper number to. On one hand, these exclusive, Lunar New Year switches have all the frills and fun attached that any switch enthusiast could *possibly* dream of from the switch itself down to the packaging. On the other hand, though, the higher than previous price point and lack of broad innovation from the TTC OG Tiger switches of last year is almost certainly too harsh for the broad public to stomach.

#### Other

For the lack of broad improvements and developments made to the TTC OG switches since their 2022 edition, these switches and their appearance is still incredibly refreshing and suggests that subtle, internal mechanistic changes may be around the corner for future years' releases.
