Notes

Push Feel

Listed with 45 gf weighted springs, the LCET Christmas Star switches are light weight linear switches with a short total stem travel that is cut off by a fairly pronounced, slightly sharpened bottom out onto their stem pole. Without a lot of factory lubrication present on these switches, their strokes are noticeably scratchy, with perhaps the only smoothness coming from their supposedly POM housings and POK material stems.

Wobble

Like most other LCET switches that get cranked out at their super budget price point, the Christmas Star switches have quite a bit of N/S and E/W direction stem wobble. Equal in both directions, there is some variation in this metric from switch to switch but it is overall quite rare for what it's worth.

Sound

The Christmas Star switches certainly don't sound great, though are objectively not nearly as grating to most people as they perhaps are to me. The entirety of the sound profile of these switches is driven by the medium to high pitched stem pole bottom out that is only accentuated by the scratchiness of the switches to give them a cheap, less than well thrown together sound profile.

Context

While these switches seem accessible and I know from firsthand experience that LCET switches are quite cheap and readily available in China, they are effectively completely nonexistent in the North American keyboard space and blend in with the backdrop of all other LCET made linear switches that have leaked their way over here in recent years.

Other

There is some historical question marks these throw up as being marketed as TTC Xizi replacements by Infiverse, but it's almost certain that this will remain a mystery forever.
