

## TTC Blueish White

Last Update: 03/26/2023 (V2)

TTC Blueish White		
Switch Type: Tactile		TTC
28	/35	Push Feel
15	/25	Wobble
6	/10	Sound
14	/20	Context
7	/10	Other
70	/100	<b>Total</b>

### Notes

#### Push Feel

While their uniqueness has become a bit less stand out in time, the TTC Blueish Whites still offer a rather interesting overall feeling with a mid-range tactility that provides the snappiness that more 'high strength' tactile switches have without the extra force required to get over the bump. As well, the housing collisions are not the most balanced, though free from any sort of real character defects by way of material choices for such.

#### Wobble

Being one of the earliest switches released in TTC's more modern repertoire, Blueish Whites on average have a slightly higher amount of N/S and E/W direction stem wobble than more recent TTC releases. Sure, the most recent batches from 2022 and 2023 may be a tad on the better side with silent mold improvements, but on average the Blueish Whites are towards the bottom of the modern TTC switch wobble totem pole.

#### Sound

Following the push feel notes above, the snappy and mid-weight tactile bump is matched with a slightly sharp, mid-pitched noise that pitches upwards with higher actuation speeds. This is the one feature of the switch which has remained the most unique as the Blueish Whites have aged over the past 2 to 3 years since their release.

#### Context

While TTC has gone on to bigger and better things, the staying power of the TTC Blueish Whites is admirable, all things considered. A big drag on the contextual evolution of these switches, though, is that they've simply been outclassed at a price per performance level not just broadly, but also by TTC who continues to improve to date.

#### Other

Relegated a bit more to the history books than when they were freshly released, the TTC Blueish Whites will forever stand alongside Gold Pinks as the 'starters' of the modern TTC switch era.
