Notes

Push Feel

Coming in as a high-set, medium range tactile switch, there isn't any real surprise with the expectations of this switch. The downsides, such as a tiny linear pre-travel region and rough interaction between the stem legs and leaf, leave these feeling a bit less than expected for Durock/JWK switches of this type.

Wobble

The stem wobble is good in both N/S and E/W directions, with the N/S direction being ever so slightly greater in magnitude. The top housing doesn't appear to have any wobble, either.

Sound

The sound on these switches, in stock form, is simply not great. They've got an incredible amount of spring ping, a sharp and flat topping out, and a scratchy leaf-leg interaction that sounds off in both up and downstroke. The only saving grace here is that for being unlubed from the factory they aren't super scratchy sounding.

Context

While often times people like to rag on stuff as 'just recolors' even though there's plainly obvious differences to the switch, this is one of the few times I kind of get it. There's no innovation here. Hell, the things it emulates it doesn't even really do well. These are going to be a forgettable switch to many for anything less than the color itself.

Other

One of the minor saving graces of this entire switch is that they are an excellent switch to push into the hands of people who are diehard modification enthusiasts. These switches, to be at a level most people would like, are going to require films, lubing the stems, spring swapping, and likely a touch of lube application on the leaf. An absolute full gamut of mods.
