Notes

Push Feel

Released alongside the GMMK Pro 3.0 as well as a slew of other Glorious switches, the Glorious Panda Silents are an Outemu-made silent tactile take on their flagship Panda switches. Using the same slider-rail insert dampening mechanism that has been used on silent MX switches since they were first developed, the Panda Silents have a noticeable mush to their housing collisions which make the mid-stroke tactile bump feel small, insulated, and hardly present. Additionally, what factory lubing that is present also makes this mushiness feel a bit squishy at certain points in some of the switches that I tested.

Wobble

Like most of the other Glorious switches that I've looked at that were released from around this time, the Panda Silents have a slight bit greater E/W direction stem wobble than N/S direction. The larger of these two, though, is not likely to be problematic to the majority of users using these switches – and especially if they are in Glorious' newer, younger target demographic.

Sound

The Glorious Panda Silent switches do deserve some credit insofar that they are largely silent, without even the tactile bump producing any noise between the stem legs and the leaves. That being said, what sound is produced is subtly scratchy, gummy, and otherwise distracting from a fairly good sound sink of a silent switch.

Context

While Glorious is deserving of some credit insofar that they've increased options and variations of generally popular switches of theirs with this release, the price point at \$0.97 per switch is insanely beyond any sort of reasonable price point for the performance afforded here.

Other

The Glorious Panda Silents, like most other switches released by Glorious in this release, feel as if they're trying to market on an idea that isn't actually backed up anywhere in reality...
