Notes

Push Feel

Having a mid-stroke bump with decent sharpness and size, these don't particularly stand out as anything impressive, but occupy a nice mid-high range tactile switch range. A solid, thick, and otherwise uncompromised bottoming out noise accompanies this, with the only detractors from this score being the fair amount of scratch in the linear pre and post travel regions.

Wobble

While an ever so slightly loose top housing does allow the use of a variety of switch film thicknesses, it will also detract from this score a bit. More importantly, though, the extremely noticeable wobble in both the N/S and E/W directions of the stem (with caps on even) really does hurt the overall wobble score of these switches.

Sound

Slight spring ping aside, these are quite *loud* tactile switches with both up and downstroke bumps producing a flat, mid-range pitched, and resounding sound that is uniquely loud for tactile switches of this strength.

Context

These first switch attempts by AEBoards based out of Australia are certainly an interesting burst onto the scene, but the otherwise large packs of switches from only two vendors finds them a hard to consider option for something so otherwise unknown in the western market.

Other

While the lack of advertising has made these intriguing, initially, the novelty of them – sound included – wore off a bit too quickly. It does, however, make me interested in whatever AEBoards has in store next.
