Notes

Push Feel

The HMX Snowfalls are medium strength tactiles with a long, smooth, and arching bump that feels surprisingly light when compared to the strong, flat but forceful stem pole bottom out they ground out into after only the shortest of post-bump linear travels. Similar to the Gateron Azure Dragon V4s, these feel as if they have such strong bottom out notes that it almost makes their tactile bumps feel soft or barely tactile at all by comparison and also is extremely unbalanced with the topping out.

Wobble

Like most HMX-made switches, these feature incredibly little stem wobble in either N/S or E/W directions that is fairly consistent from switch to switch.

Sound

Despite boasting 'modified nylon' bottom housings, the HMX Snowfalls are incredibly loud tactiles with sound profiles that almost entirely consist of a pointed but flat, loud stem pole bottom out that comes across almost pen click-like in its tone. A lack of scratch from good factory lubing and otherwise 'soft' housing collisions truly leave these as utterly one dimensional in their sound profiles with just the bottom out to note.

Context

While priced at a strong price point of ~\$0.42 per switch and available from a notable few vendors, these are unlikely to stand the long test of time as compared to other HMX-made tactiles such as the Akko Cilantros or Firecrackers on account of their more extreme construction and thus niche interests that they fulfill.

Other

HMX is definitely deserving of props here for both aesthetically pushing these switches with top housing sparkle as well as trying to fill a niche in tactile switch offerings, though here it does somewhat result in a less polished, overall clean performing tactile like HMX's other attempts.
