Notes

Push Feel

With a nylon-based smorgasbord of components including full nylon tops, modified nylon stems, and 50% fiberglass reinforced nylon bottom housings, the Keygeek Full Nylon switches are an interesting of just how far the 'full nylon' switch has come. At normal typing speeds these are the classic trope of such – deep, firm, solid with a smooth, effortless stroke and subtle housing collisions. At higher actuation speeds, though, the bottom outs will take on inconsistent, somewhat pointed feeling collisions that are inconsistent and modulate with typing speeds.

Wobble

The Keygeek Full Nylons have exceedingly little N/S and E/W direction stem wobble – with only the slightest budes in each direction. This metric is also consistent from switch to switch.

Sound

The sound profile of the Keygeek Full Nylons is one that is exactly in line with the expectation of full nylon switches at low typing speeds – deep and bassy sounding, with softened housing collisions that make the switches sound a like black hole of sorts. Much like with the push feel notes above, though, at higher typing speeds these begin to take on snappier, more inconsistent bottom outs that vary from stroke to stroke.

Context

While these are priced at \$0.35 per switch, as seemingly most new, exciting switch offerings are, they seem incredibly under-represented in western markets despite being made of all nylon, from Keygeek, and a collaboration with broadly successful brand XLLAB. I'm incredibly uncertain as to how long these will be available despite being solid performers.

Other

As manufacturers like Keygeek continue to explore modified material housings, it was only a matter of time before they tried something like this. With enough differences from truly 100% nylon housings, these paint an interesting future for what switches could be made from...
