Notes

Push Feel

Built as the lightly tactile, early snapping counterparts of the Kailh Calligraphy linears, the Xuans are a switch predominantly centered around the interaction of their melamine formaldehyde (MF) stems and liquid crystal polymer (LCP) housings. These interactions – at topping and bottom out – produce snappy housing collisions that feel airy without the thinness or sharpness of comparable other feelings and is fairly consistent across the batch received. As well, the Xuans are certainly not the best lubed from the factory, though the MF on LCP friction does give a unique grain feeling to their strokes that is not gravely, though definitely unique in texture.

Wobble

Present equally in both N/S and E/W directions, the Xuans have a better than average but potentially noticeable amount of stem wobble that is only likely to bother users that are particularly picky about this metric.

Sound

In the most of ideal states, the light tactile bump meshes well with the housing collisions of the Xuans to produce a rich, rounded snappiness that is medium-high in volume towards the higher end of the pitch with only subtle undertones of velvet scratch. However, the batch of Xuans I received suffers greatly from cross-batch variability in the 'profile' of the switches' sound at housing collisions causing some to sound quite more substantial than others.

Context

While the Kailh Xuans are priced well \$0.45 per switch and have some vague community awareness on account of a few Calligraphy reviews, Kailh is historically bad at propagating R&D successes such as MF and LCP housing materials into continual or future releases of switches.

Other

With incredibly fun housing materials and a well balanced tactility that doesn't override them, I feel sad these switches haven't gotten nearly as much community attention as they do deserve.
