Notes

Push Feel

Built with UPE stems over a light, 50 gf. bottom out spring in a classic polycarbonate over nylon housing scheme, the Wingtree Jadeites are unexpectedly tight, solid, and deep linears with a feeling driven primarily by their bottom out. While there is some consistency issues with such, as well as a light shuffling scratch throughout the push feeling of these switches, the bottom outs do well as the star of the show with firm, ever so slightly muted, and wide feeling housing collisions.

Wobble

With only the slightest of inconsistencies in N/S and E/W direction stem wobbles between switches, there's almost no wobble to the Jadeites whatsoever under normal use cases. There's no reasonable keyboard community member who could have an issue with this metric here.

Sound

While the polycarbonate over nylon housing combination has historically produced some rather thin, high pitched sounding switches, the Jadeites are anything but that, having a bassy depth that matches their push feeling notes above. However, the noted inconsistencies in bottom out feeling are more so noticeable in their sound with some bottom outs just not quite striking with as much force or strength of feeling as others from stroke to stroke.

Context

Priced around \$0.35 per switch, these are rather strong in terms of their price per performance though largely underappreciated in the eyes of the community. Like most other Wingtree switches, these just do not have the long term marketing or novelty that will likely lead to them being around for more than a brief window of time until Wingtree develops another switch.

Other

While not necessarily novel nor revolutionary to the use case of these switches, the color-matched LED diffuser wedges in the Jadeite switches is a nice, uncommonly seen design touch.
