

HMX Crisp

Last Update: 04/12/2026

HMX Crisp		
Switch Type: Linear		HMX
26	/35	Push Feel
23	/25	Wobble
3	/10	Sound
10	/20	Context
4	/10	Other
66	/100	Total

Notes

Push Feel

Designed and marketed around their inclusion of Teflon powder embedded in their housings, the HMX Crisps are linears that ultimately are ‘just okay’ by modern standards and not really improved at all by these changes. While the average switch is smooth and with somewhat thin feeling housing collisions, these suffer quite a bit from batch-wide variability with some switches feeling (and sounding) significantly thinner, flimsier, and sometimes even scratchier than their more well-constructed counterparts.

Wobble

While the HMX Crisp switches have very little to almost no E/W direction stem wobble, there is a tiny, almost certainly unproblematic amount of N/S direction stem wobble that gives them an asymmetric feeling on this metric.

Sound

All of the inconsistency and variability noted above in the push feeling of the HMX Crisps is only more so prevalent in the sound of them. Across the batch you get everything ranging from scratchy to overly lubed, thin, sharp housing collisions and deeper, snappier ones, and even quite a bit of variation on all of these things across different typing speeds. While they are free from overtly scratchy or pingy sounds on the whole, it is kind of hard to pin down what these switches *are* supposed to sound like...

Context

Despite being priced cheaply at sub \$0.35 per switch, these are just far from being HMX’s best work. On top of no marketing and a limited worldwide sales reach, it is unlikely these will be remembered at all in the coming months even in spite of their unique housing materials.

Other

While HMX does deserve *some* credit for trying to stretch towards a unique material choice for these housings, the end result definitely just isn’t there and requires quite a bit more work yet.
