73	/100	Total

Notes

Push Feel

Featuring a stem design and tactile bump aimed at replicating the groundbreaking Sillyworks x Gateron Type R's tactility, the HMX Hydras come decently close but still a tiny bit off. The Hydras are early stroke, forceful tactile switches with a strong, but long, unfurling tactile bump that lands off at an even stronger, more pointy bottom out with only a tiny bit of linear landing strip in between them. The ever so slight factory lubing leaving some degree of scratch isn't as noticeable here, though only because of how overwhelmingly aggressive the collisions are in these switches and their occasional inconsistencies across typing speed.

Wobble

With an equal magnitude N/S and E/W direction travel, the HMX Hydras are a tiny bit better than the average keyboard switch though well within HMX's normal production range/ability.

Sound

These are definitely a clicky fan's idea of a tactile when it comes to their sound – loud, pointed, and even a bit sharp on the ears at normal typing speeds and only more aggressive the faster they are typed on. While this sound is more emphasized in the bottom out than the (barely) more subdued, punchier tactile bump they make for quite a duo that morph into higher pitched and tackier punches at higher actuation speeds.

Context

Priced ~\$0.42 per switch and available through quite a few different vendors, the Hydras have sustained some minor success among HMX-made tactiles in the months since their release. The constant flood of HMX's tactiles, though, mean these will likely last a few months longer but not have sustained interest once the newest, shiniest HMX tactile hits the scene.

Other

While one of the better attempts at a Type R redux by anyone other than Gateron, XLLAB has shown better design execution and finer detail polishing than what is here in these switches.
