Notes

Push Feel

Billed as lightly forceful silent tactile switches with full polycarbonate housings, the Orchid Mantis switches surprisingly balance these historically conflicting features well to deliver a switch that has an early hitting, low strength bump that unfurls into dampened but not squishy bottom outs. While there is a bit of a scratch to these switches as well as ping that is especially noticeable in their stem leg/leaf interactions, these don't initially come across nearly as thin or flimsy as one might assume.

Wobble

Present equally in the N/S and E/W directions, there's a borderline bothersome amount of stem wobble that likely won't bother the majority of people. That being said, though, it is still definitely there and something that could have been improved upon by Haimu.

Sound

At any reasonably low typing speeds the Haimu Orchid Mantis switches are largely quiet, something which directly contrasts with the historical precedent of full polycarbonate housing constructions. What little sound there is from these switches, which does admittedly grow a bit to noticeable levels at faster typing speeds, is that of the ping from their stem leg/leaf interactions that were noted in the push feeling notes above.

Context

Priced at \$0.30 per switch and unveiled as part of Cannonkeys' early 2026 flood of custom Haimu offerings, the Orchid Mantis switches fill a niche that is currently present on the open switch market and likely have some staying power as part of their core offerings. General community awareness of these switches, though, is a tiny bit lacking.

Other

While there is a fair bit left to be desired from the execution, the use of full polycarbonate housings for a *silent*, lightly tactile switch is a notably interesting combination of features.
