19	/25	Wobble
6	/10	Sound
10	/20	Context
5	/10	Other
68	/100	Total

Notes

Push Feel

Only vaguely different than the original Lightning V1 switches from many years prior, the KTT Lightning V2s are late 2025/early 2026 KTT linears with a moderate bottom out force ~60 gf, a slightly shortened overall stem travel, and decently well applied factory lubing. While some inconsistencies can be felt from switch to switch in that factory lubing, with some switches being ever so slightly scratchier than others, the main feature of the Lightning V2s' performance is their contrastingly poppy, thinner feeling polycarbonate top outs opposite of their nylon housing bottom outs.

Wobble

Ever so slightly greater in the N/S direction than the E/W direction, the Lightning V2 switches have a better than average amount of stem wobble that is unlikely to be bothersome to most users.

Sound

Much like the push feeling notes above, the KTT Lightning V2's sound profile is one that is largely driven by the one-two punch combination of their deeper, slightly more firm bottom outs opposite that of their lighter, brighter, and thinner sounding topping outs. While this can sometimes be a bit jarring in switches, it's actually done decently well here and only really hindered by the tendency for the switches to pitch up in tone at faster actuation speeds.

Context

While these were priced like most other KTTs for quite some time post their release, they've largely dropped off like a rock in terms of availability. Mixing this with KTT's general slowing of production in 2026, it's entirely uncertain if these have much, if any, life to them contextually.

Other

Opaque top housings mixed with a subtle gold metallic flair make for one of the neater mono-colored housing designs I've seen in some time even if a bit visually dull from a distance.
