Notes

Push Feel

Designed by Toro Studio and manufactured by Wingtree, the Torrero are canonical light tactile switches with a mid-stroke, small strength bump that is wide and surrounded on both sides by slightly scratchy feeling strokes and nylon-based housing collisions. In a very real way they are what I imagine a lot of people remember the iconic Cherry MX Brown feeling like, though with a smoother, more leathery scratch as well as an ever so slightly snappier downstroke bump that has a subtle flicking feeling to it as it progresses through its peak force.

Wobble

Present equally in both the N/S and E/W directions, the Wingtree Torrero switches have a moderate but not too likely to be problematic amount of stem wobble. It is admittedly a bit more than I would have expected for a switch that has proprietary, custom stems molded in POM.

Sound

At low to normal typing speeds the Torrero are definitely fun sounding switches – deep, brooding, bass focused, and with a deceptively snappy sounding tactile bump despite its strength and richer, more leathery scratch tones.. However, faster actuation of these switches at semi-fast normal to fast typing speeds induces a lot of thinner, higher pitched sounds through the housing collisions that contrast the best parts of these switches' sound profiles not too well.

Context

Priced at \$0.35 per switch and championed by Unikeys, I've seen a fair bit of marketing and discussion surrounding these switches relative to what is common in 2026 for MX-style switches, though I'm wholly unsure how long these will remain available for.

Other

Would it even be a good representative light tactile switch if it didn't have flaws? In a way I feel like the scratch and tonal inconsistencies seen here in the Torrero are almost as critical to the overall 'vibe' of such switches as the mid-stroke, low-strength tactile bump.
